

CLAUDE CODE SKILL · how-to

Build a Polished How-To PDF in Four Steps

The how-to skill turns a folder of screenshots into a clean, uniform walkthrough PDF — a typeset cover, shadowed cards, slide numbers, optional step headers, and UI clean-up. Point it at your images, describe them in a small config, and run one command.

1 Gather your screenshots in one folder

my-screenshots

Drop your captures in one folder — they render in filename order.

01-open-app.png

1.2 MB

02-search.png

980 KB

03-results.png

1.1 MB

04-detail.png

1.0 MB

2 Describe them in a guide.json config

```
guide.json

{
  "title": "My Product – Quick Start",
  "intro": "A two-line walkthrough of the basics.",
  "eyebrow": "MY PRODUCT · GUIDE",
  "footer": "ACME · How-to",
  "output": "My Guide.pdf",
  "slides": [
    { "image": "step1.png" },
    { "image": "step2.png",
      "header": { "number": 4, "label": "Verify" } }
  ]
}
```

3 Run the build script

```
bash — how-to

$ python3 ~/.claude/skills/how-to/scripts/build_guide_pdf.py \
  --config guide.json

saved /Users/you/My Guide.pdf (5 pages)

$ open "My Guide.pdf"

Tip: no config? quick mode takes a folder:

$ ...build_guide_pdf.py --images ./shots --output g.pdf \
  --title "My Guide" --intro "..."
```

4 Verify the output, then re-run after edits

Open the PDF and check the layout

Re-run after edits — same style, every time.
